

# The Globe

1. Colour in and cut out the template of the 2D globe.
2. Cut around the 12 segments (gores) that make up the globe. Cut right in between the gores so your scissors almost touch the equator (the line running through the middle).
3. Roll the cut-out into a cylinder and sellotape together both ends of the equator where they meet.
4. Place a large square piece of sellotape under the pointed end of one of the gores, so the sticky side faces upwards.
5. Bend the other 11 gores into the middle, so the tips meet at the same point.
6. Stick them down firmly on the tape. This end should now be cupped.
7. Do the same with gores at the other end to create a sphere.

Don't be disappointed if your globe is not a perfect sphere. It is actually impossible to recreate a perfect sphere from a simple template like this!
